Introduction

Sound Delay is an auxiliary multi-channel signal delaying plug-in for professional audio applications. You may specify delay time in both milliseconds and samples, with a high level of precision. This plug-in being technical in its purpose, provides a basic signal delaying function only, without signal feedback or modulation capabilities.

Sound Delay also features internal mid/side encoding and decoding, and allows you to delay mid and side channels independently.

Features

- Sample-accurate delaying
- Millisecond-accurate delaying
- Up to 12 seconds of overall delay
- Phase-invert switch
- Stereo and multi-channel processing
- Internal channel routing
- Channel grouping
- Mid/side processing
- Preset manager
- Undo/redo history
- A/B comparisons
- Contextual hint messages
- All sample rates support

Compatibility

This audio plug-in can be loaded into any audio host application that conforms to the AAX, AudioUnit, VST, or VST3 plug-in specification.

This plug-in is compatible with Windows (32- and 64-bit Windows XP, Vista, 7, 8, 10 and later versions, if not announced otherwise) and macOS (10.11 and later versions, if not announced otherwise, 64-bit Intel and Apple Silicon processor-based) computers (2.5 GHz dual-core or faster processor with at least 4 GB of system RAM required). A separate binary distribution file is available for each target computer platform and audio plug-in specification.

User Interface Elements

Note: All Voxengo plug-ins feature a highly consistent user interface. Most interface elements (buttons, labels) located at the top of the user interface are the same in all Voxengo plug-ins. For an in-depth description of these and other standard features, and user interface elements, please refer to the “Voxengo Primary User Guide”.

Audio Delay

This group of knobs specifies delay time in a selected dimensionality (milliseconds, meters or feet). Note that each knob affects a single decimal position of the whole delay time value.

During calculation of delay time expressed in meters or feet, it is assumed that the speed of sound propagation equals 340.29 meters per second.

The “Quick entry” field allows you to enter delay value as a single number.

Sample Delay

This group of knobs specifies sample-accurate delay.

Output

This panel features overall output level adjustment knob together with the output level meter, displayed in decibel. The “180” switch can be used to flip the phase of the output signal by 180 degrees.

Note that summary delay is composed from the sum of the “Audio Delay” and “Sample Delay” settings. The maximal summary delay time this plug-in provides is 12 seconds. If a specified summary delay is higher than 12 seconds it will be set to 12 seconds.
